

Exercise Session 6

MDMC Spring 2025

Evan Vasey, Thibault Kläy, Qihao Zhang, Salomé Guilbert, Sophia Johnson, Andrea Levy

May 13, 2025

Reminders

- Today is the *final* exercise session - optional report (only best 5 out of 6 graded)
- No interview for report of Ex6
- **Extended deadline** for this report: Sunday June 29th at 23h59
- Even if you decide to not do the report, read the theory and the exercise! Important knowledge to better understand MD (possibly useful for the exam!)
- Important Dates:
 - Q&A Session and mock exam on Tuesday May 20th in lecture classroom – send us your questions on moodle in advance!
 - Written exam on Tuesay May 27th in lecure classroom

Written exam - information

- 1 page of summary notes will be permitted during the exam (1 A4 size paper, front and back)
- Calculators will be permitted during the exam, but not necessary
- No other electronic device allowed
- We will provide paper to write your answers

Exercise 6 - Reminders

- **Note** This tutorial should be run on **gnoto** JupyterHub and not on **noto** JupyterHub. This is because we will use GPU-accelerated techniques to speed up the simulations.
- To this end, please use the following link instead of the usual rocket button: [gnoto link](#)
- **Select** the correct kernel for this exercise CH-351

Exercise 6 - Set up gnoto

- Select the correct kernel for this exercise CH-351

tools in that it is not controlled by executing different subprograms in the cell.

The respective parts you need to change during the exercise are indicated.

Exercise 6 - Learning Goals

 Learning goals	 Chapter in script	 Resources
<p>Learn how to simulate solvated systems</p> <p>Run a production grade simulation using a GPU</p> <p>Simulate protein folding of a small peptide</p> <p>Perform a basic analysis of an MD trajectory</p>	<p>Chapter 6 - Advanced Molecular Dynamics Techniques</p>	<p>Simmerling, C., Strockbine, B., and Roitberg, A.E. All-Atom Structure Prediction and Folding Simulations of a Stable Protein J. Am. Chem. Soc. 2002, 124, 38, 11258–11259 https://doi.org/10.1021/ja0273851 Braun, E., Gilmer, J., Mayes, H. B., Mobley, D. L. ., Monroe, J. I., Prasad, S., & Zuckerman, D. M. . (2018). Best Practices for Foundations in Molecular Simulations [Article v1.0]. Living Journal of Computational Molecular Science, 1(1), 5957. https://doi.org/10.33011/livecoms.1.1.5957</p>

Exercise 6 - Context

Today you will perform a MD simulation of a Trp-cahe miniprotein

- Smallest protein to display two state folding properties, ideal candidate for computational folding simulations
- Folding dynamics of this protein with explicitly defined water molecules (see Theory section for details) is a lengthy and computationally costly process. We will use of an implicit solvent model to reduce computational cost and still include, in approximate detail, the effects of water solvation.
- You will replicate the work of [Simmerling et. al. in 2002](#)

miniprotein. The simulations we have described did not include any structural or other experimental data for the trpcage but still converged to a highly similar family of conformations. In addition, our simulations suggest plausible structural details beyond those available from NMR models, such as the Asp-Arg salt bridge. This demonstrates that MD simulations have reached the point where accurate structure refinement and prediction through direct simulation are not only becoming possible but may soon also be routine enough to contribute significantly to our understanding of the factors that determine folding. Extension to larger systems is a challenging step for the future.

Exercise 6 - Analysis

The analysis of the MD trajectories:

- You will look at different properties during the simulation, comparing to the experimental structure (PDB 1L2Y)
